#### Abstract

Childhood is a blissful state of innocence and joy but this is often not for the children, who are disabled, when they play, laugh; they feel isolated, as no one is beside them to hear or bear, as everyday in their life is a big struggle. Disability is proven to be a big hindrance in the normal day-to-day life of a place of negligence, despair and isolation. Visually handicapped children are a highly heterogeneous group they face many problems like behavioral problems, problems of social adjustment, problems in learning, poor intelligence, academic difficulties. Slower speeches etc and sense are gateway of knowledge, the sensory deficit in vision reduces the range and qualities of cognition. METHOD:-it deals with defining the problem, formulation of hypothesis, methods adopted for data collection and statistical techniques used for analyzing the data with logical reason behind it. This chapter deals with the description of methodology and different steps, which were under taken for gathering and organizing data for the investigation. It includes description of research approach, research design, setting of the study, population, and sample and sampling technique, development and description of tool, testing of the tools, pilot study, procedure for data collection, plan for data analysis. RESULTS:- INTERPRETATION:-The data was collected from children. 50 visually impaired. The data collected were grouped and analyzed by using Descriptive Statistics and Informational statistics. The data is analyzed on the basis of the objectives and hypothesis of the study. CONCLUSION:-This chapter presents the conclusions drawn, implications, limitations, suggestions and recommendations. The main focus of these studies was to assessment of implementation of protocol on psychosocial problems and coping strategies

among blind children. The data was collected from 50 subjects.

## I. INTRODUCTION

As per the persons with disability act 2012, Government provides education, employment, creation of barrier free environment and social security to the disabled ${ }^{2}$ Blindness is a condition "where a person suffers from visual acuity worse than (3/60) or less in the better eye with correction or a visual field of less than 10 degree' Blindness imposes sociological, psychological and education limitations on the individual (lowenfeld 2012).Visually handicapped children are a highly heterogeneous group they face many problems like behavioral problems, problems of social adjustment, problems in learning, poor intelligence, academic difficulties. Slower speeches etc and sense are gateway of knowledge, the sensory deficit in vision reduces the range and qualities of cognition. In school age children: congenital and development anomalies, neurological (papillates, papilledema) and trauma. ${ }^{7}$ this is supported by a study conducted by dandona in 2003 on prevalence and causes of blindness in children at Hyderabad. The results of the study show vitamin A deficiency (8.3\%), congenital anomalies ( $25 \%$ ), retinal degeneration (16.7\%) and nystagmus related amblyopia (8.3\%). Another study revealed that prenatal factors were the main causes of childhood blindness (52\%).Visual impairment is a significant health problem worldwide. The World Health Organization estimates that globally about 314 million people are visually impaired, of whom 45 million are blind in which 1.4 million are children. ${ }^{4}$ Blindness is a devastating physical condition with deep emotional and economical
implications. Various problems that the blind people face are problems in orientation and mobility, personality problems, psychological problems etc. There are certain coping strategies that a visual impaired person adopts, which includes positive strategies and negative strategies

## II. RESEARCH METHODOLOGY

The researcher design selected for the study was cross sectional descriptive survey research design. Sociodemographic variablesAge, Gender, Education, cast, Income, Type of family, Frequency of visitors, Disabled sibling in the family, Causes of blindness, Duration of residential in blind school. And study variable include psychosocial problems and coping strategies among blind children.In this study sample size 50 blind children who are in the age group of 12-16years and above are selected by purposive sampling technique. Research Approach:A quantitative evaluative approach was used Research Design A researcher's overall plan for obtaining answers to the research question for testing the research hypothesis is referred to as the 'research design'. It spells out the basic strategies that the researcher adopts to develop information that is accurate and interpretable ${ }^{46}$. In the present study research design refers to the plan of a scientific investigation. Research design helps the research in selection of subjects, identification of variables, their manipulation and control, observation to make and types of statistical analysis to interpret the data, among blind children's. Population:-The population of the present study comprises on children living in blind school. Target population:The target population are blind children residing in Bagalkot district, accessible population are blind children who are received services in shri manic prabhu academy for the blind and assist depth organizer for rehabilitationAccessible population:The accessible population includes blind children residing at 52 sectors Navanagar Bagalkot. Sampling Technique:Convenient sampling technique was used to select the blind school and sample. From that blind school. Sample Sample consist of subjects of units selected from the accessible population in the present study sample includes blind children staying in blind school Navanagar Bagalkot, andamakkalavasati school Navanagar Bagalkot. Sample size: Sample size for the present study consists of 50 visually impaired children i.e. 50 children fromSajeevaAndhamakkalaVasati School sector no 52. Academy for the blind and 50 blind children who are receiving services at assess organization for rehabilitation Bagalkot within the age group of 08-14 years. Method of Data Collection:- Data Collection is gathering of information relevant to the research problem. The tool was modified by considering the experts suggestions and results of pilot study. Data were collected by self administered structured knowledge closed ended questionnaire.Data was collected in blind school. Data Collection:-The data collectionwas carried out from 01-03-2019 to 14-03-2019. Permission was obtained from the Headmaster

SajeevaAndhamakkalavasati school sector no 52, Navanagar Bagalkot. RESULTS:-The purpose of analysis is to reduce the data to intelligible and interpretable forms so that the relation of problems can be studied and tested. The interpretation of tabulated data can bring to light these real meaning of the finding of the study. Analysis and interpretation of data for present study is based on data collected from 50 blind children's from blind school Navanagar Bagalkot.

The data analysis is described as categorizing, ordering, manipulating and summarizing the data obtain answer to research questions. The purpose of analysis into reduces the data to an intelligible and interpretable from so that the relation of research problems can be studied. The data is analyzed on the basis of the objectives and hypothesis of the study.

## III. ORGANISATION OF FINDINGS:

PART- I: Assessment of data related to SocioDemographic variables.
PART-II. Assessment of level of Psychosocial Problems and coping strategies.
Section A: Assessment of data related to DASS.
a. Assessment of data related to depression.
b. Assessment of data related to anxiety.
c. Assessment of data related to stress.

Section B: Assessment of data related to Social problems. Section C: Assessment of data related to Coping strategies.
PART-III Assessment of Co relation between psychosocial problems and coping strategies.
Section-A. Co-relation between Psychological Problems with coping strategies.
Section-B. Co-relation between Social Problems with coping strategies.
PART-IV. Association between psychosocial problems with selected socio-demographic variable of blind children.
Section-A. Association between psychological problems with selected socio-demographic variable of blind children.
Section-B. Association between social problems with selected socio-demographic variable of blind children.
PART-V. Association between coping strategies with selected socio-demographic variable of blind children.
PART- I: Assessment of data related to SocioDemographic variables.

The Socio demographic variables are distributed in terms of Age. Gender. Education. Cast. Income. Type of Family. Disabled Sibling In The Family. Frequency of Visitors. Causes of Blindness. Duration of Residential In Blind School.

| Table-2.4 |  | $\mathrm{N}=50$ |  |
| :---: | :---: | :---: | :---: |

Table1:- Frequency and percentage distribution according to Age.

PART- I: Description of socio-demographic characteristics of sample.
Percentage wise distribution of children's according to their age group reveals that out of 50 subjects, the highest percentage ( $38 \%$ ) of the subjects belongs to age group of 12-13 years. Followed by ( $36 \%$ ) in the age group of 10-11 years. Average percentage of $(24 \%)$ in the age of $14-15$ years. Last one lowest percentage of ( $2 \%$ ) in the age group of 16 years above. (Fig: 6.1). $\mathrm{NO}=50$

| AGE | FREQUENCY | PERCENTAGE |
| :---: | :---: | :---: |
| $10-11$ years | 18 | $36 \%$ |
| $12-13$ years | 19 | $38 \%$ |
| $14-15$ years | 12 | $24 \%$ |
| $16+$ years | 01 | $02 \%$ |

Fig.-1 Frequency and Percentage Distribution According To Gender.
Percentage wise distribution of children according to gender reveals that out of 50 subjects. Highest percentage (52\%) of the subjects were male and lowest percentage ( $48 \%$ ) of the subjects were female and lowest percentage. It reveals that majority of blind children under this study were male children (Fig:6.2)

| GENDER | FREQUENCY | PERCENTAGE |
| :--- | :--- | :--- |
| MALE | 26 | $52 \%$ |
| FEMALE | 24 | $48 \%$ |

Fig.-2 Frequency and percentage distribution according to Education.
Percentage wise distribution of children according to education reveals that out of 50 subjects. Highest percentages (74\%) of the subjects were primary and lowest percentages (13\%) of the subjects were high school. It reveals that majority of blind children under this study were primary children (Fig: 6.3)
$\mathrm{NO}=50$

| EDUCATION | FREQUENCY | PERCENTAGE |
| :--- | :--- | :--- |
| PRIMAY | 37 | $74 \%$ |
| HIGH SCHOOL | 13 | $26 \%$ |

Fig. 3 Frequency and percentage distribution according to Cast.
Percentage wise distribution of children according to Hindu, Muslium. Christian, reveals that out of 50 subjects. Highest percentages ( $80 \%$ ) of the subjects were Hindu. average percentage ( $14 \%$ ) of the subjects were Muslim. And lowest percentage of (6\%) of Christian It reveals that majority of blind children under this study children (Fig: 6.4)

| NO $=50$ |  |  |
| :--- | :--- | :--- |
| CAST | FREQUENCY | PERCENTAGE |
| HINDU | 40 | $80 \%$ |
| MUSLIUM | 07 | $14 \%$ |
| CHRISTIAN | 03 | $06 \%$ |
| OTHERS | 00 | $00 \%$ |

Fig.-4 Frequency and percentage distribution according to Income.
Percentage wise distribution of children according to income, reveals that out of 50 subjects. Highest percentages (44\%) of the subjects were $10,000-15.000 /-$. average percentage ( $40 \%$ ) of the subjects were below $10,000 /-$. And lowest percentage of ( $16 \%$ ) of $15,001-20,000 /-$ It reveals that majority of blind children under this study children (Fig: 6.5)
$\mathrm{NO}=50$

ISSN No:-2456-2165

| INCOME | FRIQUENCY | PERCENTAGE |
| :--- | :--- | :--- |
| BELOW $10,000 /-$ | 20 | $40 \%$ |
| $10,000-15,000 /-$ | 22 | $44 \%$ |
| $15,001-20,000 /-$ | 08 | $16 \%$ |
| ABOVE $20,000 /-$ | 00 | $00 \%$ |

Fig.-5 Frequency and percentage distribution according to Type of family.
Percentage wise distribution of children according to nuclear, joint family. Reveals that out of 50 subjects. Highest percentage (72\%) of the Nuclear Family. were Joint family. (28\%) (Fig: 6.6) $\mathrm{NO}=50$

| FAMILY | FRIQUENCY | PERCENTAGE |
| :--- | :--- | :--- |
| NUCLEAR FAMILY | 36 | $72 \%$ |
| JOINT FAMILY | 14 | $28 \%$ |
| EXENDEND FAMILY | 00 | $00 \%$ |

Fig.-6 Frequency and percentage distribution according to sibling in the family.
Percentage wise distribution of children according to Sibling of family, reveals that out of 50 subjects. Highest percentages $(78 \%)$ of the subjects were any othr specify. average percentage ( $12 \%$ ) of the subjects were deaf \& dumb. Poor percentage of ( $8 \%$ ) of mental retardation. And very poor ( $2 \%$ ) of physical handicapped. It reveals that majority of blind children under this study children (Fig: 6.7)

$$

| Sever | $26-33$ | 14 |  |  |  |
| Extremely sever | $34+$ | 00 | $00 \%$ |  |  |

Assessment of the level of Stress of blind children's reveals that 50 sample of blind children's of Stress Normal $08 \%$ of anxiety. Mild rate of $10 \%$. Moderate $18 \%$. Sever $14 \%$. And extremely sever $00 \%$. of anxiety there were blind children's who had severe depression blind school. And mean, SD score is 21.4 $\pm$ 5.35.

Table-2.8, Frequency and percentage distribution level of Social Problems. $\quad \mathrm{NO}=50$

| SL NO | Grade | Score | Frequency | Percentage | mean | SD |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{0 1}$ | VERY POOR SOCIAL ADJUST | Below 24 | 26 | $56 \%$ |  |  |
| $\mathbf{0 2}$ | POOR SOCIAL ADJUST | $25-34$ | 22 | $41 \%$ | 7.18 | 1.5 |
| $\mathbf{0 3}$ | GOOD SOCIAL ADJUST | $35-45$ | 2 | $03 \%$ |  |  |
| $\mathbf{0 4}$ | VERY GOOD SOCIAL ADJUST | $45-56$ | 00 | $00 \%$ |  |  |

Assessment of the level of Social problems of blind children reveals that 50 sample of blind children's of Social problems Mild $01 \%$ of social problems. Moderate rate of $48 \%$. Sever $01 \%$. Social problems there were blind children's who had severe Social problems of blind school. And mean, SD score is $7.18 \pm 1.5$.

Table-2.9: Frequency and percentage distribution level of coping strategies. $\mathrm{NO}=50$

| SL <br> NO | GRADE | SCORE | Frequency | Percentage | Mean | SD |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathbf{0 1}$ | VERY GOOD | $34-44$ | 00 | $00 \%$ |  |  |
| $\mathbf{0 2}$ | GOOD | $23-33$ | 22 | $13 \%$ |  |  |
| $\mathbf{0 3}$ | POOR | $12-22$ | 20 | 46.3 | 2.76 |  |
| $\mathbf{0 4}$ | VERY POOR | BELOW 11 | 06 | $40.34 \%$ |  |  |

Assessment of the level of coping strategies of blind children's reveals that 50 sample of blind children's of coping strategies Mild $00 \%$ of social problems. Moderate rate of $00 \%$. Sever $50 \%$. Social problems there were blind children's who had severe Social problems of blind school. And mean, SD score is 20.3 $\pm 2.76$.

PART-VII. Correlation of psychosocial problems with coping strategies.

## Section-A. Correlation between psychological problems with coping strategies.

This section deals with the relationship between the psychological problems and coping strategies of blind children. In order to find the relationship the null hypothesis has been formulated
$\mathbf{H}_{3}$ - there will be no significant relationship between psychological problems and coping strategies of blind children at 0.05 level of significance.

Table :- 3.0 NO-50

| Variable | Mean | SD | r value | p |
| :--- | :--- | :--- | :--- | :--- |
| Psychological <br> problems | 27.6 | 5.83 | 0.16 | 0.0001 |
| Coping strategies | 20.3 | 2.76 |  |  |

Section-B. Correlation between social problems with coping strategies.
This section deals with the relationship between the social problems and coping strategies of blind children. In order to find the relationship the null hypothesis has been formulated
$\mathbf{H}_{3}$ - there will be no significant relationship between social problems and coping strategies of blind children at 0.05 level of significance.

Table :- 3.1 NO-50

| Variable | Mean | SD | r value | p |
| :--- | :--- | :--- | :--- | :--- |
| Social problems | 7.18 | 1.5 | 0.19 | 0.0001 |
| Coping strategies | 20.3 | 2.76 |  |  |

PART-VIII. Association between psychosocial problems with selected socio-demographic variable of blind children.
Table-3.3. Association between psychological problems with selected socio-demographic variable of blind children. $\mathrm{NO}=50$

| Sl No | Socio Demographic variable | Df | Chi- <br> Square <br> value | Table <br> value | Levels of <br> significance | Association |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 01 | Age | 01 | 2.21 | 3.84 | 0.05 | Not significant |
| 02 | Gender | 01 | 0.56 | 3.84 | 0.05 | Not significant |
| 03 | Education | 01 | 4.01 | 3.84 | 0.05 | significant |
| 04 | Cast | 01 | 0.40 | 3.84 | 0.05 | Not significant |
| 05 | Income | 01 | 1.76 | 3.84 | 0.05 | Not significant |
| 06 | Type of family | 01 | 1.49 | 3.84 | 0.05 | Not significant |
| 07 | Disabled sibling in the family | 01 | 0.34 | 3.84 | 0.05 | Not significant |
| 08 | Frequency of visitors | 01 | 0.01 | 3.84 | 0.05 | Not significant |
| 09 | Causes of blind | 01 | 1.36 | 3.84 | 0.05 | Not significant |
| 10 | Duration of residential | 01 | 4.35 | 3.84 | 0.05 | significant |

chi-square value $2.21,0.56,0.40,1.76,1.49,0.34,0.01,1.36$, were lesser than the table values (3.84) which indicates there was no significant association found between results demographic variable (age, gender, cast, income, type of family, disabled sibling in the family, frequency of visitors, causes of blind, with psychological problems $\mathrm{p}<0.05$
chi-squarer value ( $4.01,4.35$,) which indicates there was significant association found between resoled demographic variable (education, duration of residential in blind school. $\mathrm{P}<0.05$

Table-3.4; Association between social problems with selected socio-demographic variable of blind children. $\mathrm{NO}=50$

| Sl No | Socio Demographic variable | Df | Chi- <br> Square <br> value | Table <br> value | Levels of <br> significance | Association |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 01 | Age | 01 | 2.21 | 3.84 | 0.05 | Not significant |
| 02 | Gender | 01 | 0.56 | 3.84 | 0.05 | Not significant |
| 03 | Education | 01 | 3.01 | 3.84 | 0.05 | Not significant |
| 04 | Cast | 01 | 0.40 | 3.84 | 0.05 | Not significant |
| 05 | Income | 01 | 4.76 | 3.84 | 0.05 | significant |
| 06 | Type of family | 01 | 2.49 | 3.84 | 0.05 | Not significant |
| 07 | Disabled sibling in the family | 01 | 0.34 | 3.84 | 0.05 | Not significant |
| 08 | Frequency of visitors | 01 | 5.01 | 3.84 | 0.05 | significant |
| 09 | Causes of blind | 01 | 1.56 | 3.84 | 0.05 | Not significant |
| 10 | Duration of residential | 01 | 1.35 | 3.84 | 0.05 | Not significant |

chi-square value $2.21,0.56,3.01,0.40,2.49,0.34,1.56,1.36$, were lesser than the table values (3.84) which indicates there was no significant association found between results demographic variable (age, gender, cast, type of family, disabled sibling in the family, causes of blind, duration of residential, with social problems $p<0.05$
chi-squarer value ( $4.76,5.01$,) which indicates there was significant association found between resoled demographic variable (income, Frequency of visitors. P $<0.05$

Table. 3.5. Association between coping strategies with selected socio-demographic variable of blind children. $\mathrm{NO}=50$

| Sl No | Socio Demographic variable | Df | Chi- <br> Square <br> value | Table <br> value | Levels of <br> significance | Association |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 01 | Age | 01 | 2.21 | 3.84 | 0.05 | Not significant |
| 02 | Gender | 01 | 4.56 | 3.84 | 0.05 | significant |
| 03 | Education | 01 | 2.01 | 3.84 | 0.05 | Not significant |
| 04 | Cast | 01 | 0.40 | 3.84 | 0.05 | Not significant |
| 05 | Income | 01 | 2.76 | 3.84 | 0.05 | Not significant |
| 06 | Type of family | 01 | 2.49 | 3.84 | 0.05 | Not significant |
| 07 | Disabled sibling in the family | 01 | 4.34 | 3.84 | 0.05 | significant |
| 08 | Frequency of visitors | 01 | 4.01 | 3.84 | 0.05 | significant |
| 09 | Causes of blind | 01 | 1.56 | 3.84 | 0.05 | Not significant |
| 10 | Duration of residential | 01 | 0.35 | 3.84 | 0.05 | Not significant |

chi-square value $2.21,2.01,0.40,2.76,2.49,1.56$, and 0.35 . were lesser than the table values (3.84) which indicates there was no significant association found between results demographic variable (age, education, cast, income type of family, causes of blind, Duration of residential. with social problems $\mathrm{p}<0.05$
chi-squarer value $(4.56,4.34,4.01$.) which indicates there was significant association found between resoled demographic variable of Gender, Disabled sibling in the family, Frequency of visitors. P<0.05
